

Painless email encryption.

Traditional encryption means creating an account, installing an app, and managing another password. Bracket asks for one thing: wrap the subject in brackets and send. It's that easy.

THE TRIGGER

This is email encryption people actually use.

Wrap the subject in [brackets] and the message is encrypted in transit, automatically. Sign-in links are one-time-use, expire after 15 minutes, and invalidated if opened from a different device.

Clean Handoff

Senders use their go-to email client and device. Recipients open a secure link with one click. Zero friction on either end.

Layered Protection

AES-256 is just the start. One-time links, device-locked access, and personal data keys work together to close every gap.

Effortless Adoption

When encryption is this easy, people actually use it. Compliance follows, data stays put, and password reset tickets stop.

BRACKET SHARE

Send encrypted files the way you send email.

Included with every license, Bracket Share gives each user a personalized file-transfer page. Encrypted files—up to 1GB, 25 files per share—show up in the Bracket inbox just like regular messages.

CAPABILITIES THAT MAKE ENCRYPTION SECURE AND EASY TO USE:

- Device fingerprinting
- One-time sign-in links
- HIPAA and SOC 2 Type 2
- Personal data keys
- AES-256 encryption
- File transfer included
- Any email client, any device
- Works standalone, with Shield or CloudFilter
